

Agriculture Statistics 2013

**Data Collection,
Compilation,
Processing and Analysis**

**AEIMS
Department of Agriculture
Ministry of Agriculture and Forests**

A. Methodology

1) Introduction

The annual agriculture sample survey was initiated since 2004. Since, then the annual publication endeavours to presents comprehensive information on area, production and yield of principle crops viz: food-grains, oil seeds, pulses and spices, Vegetables, Fruit Crops, Roots & tubers and other horticultural crops. The publication comprises of two parts, Part 1 at National level statistics which includes national level crop and fruit production data with other analysis like price and income data, crop and fruit utilization data, Food security and coping mechanism etc. Part 2 comprises of Dzongkhag level crop and fruit production statistics.

2) Objectives

The objectives of the survey are:

- To establish reliable information on crop production and land use for planning and monitoring of agriculture development programmes.
- To collect information on indicators like annual crop production estimates, yield estimates, agriculture engaged area estimates, fruit crop production and trees estimates etc...
- The immediate objective is to generate data needed for preparation of the plans, programs and to assess the achievements.
- Prepare time series data of Land use and agriculture production trend.

3) Sampling frame

The Household listing is done by the geog agriculture extension officers. The geog agriculture extension officers annually submit the updated Household listings to the Dzongkhags. Then, the Dzongkhag validates and submits complied HHs lists to the Department.

However it was observed that with time the previous year format of HHs listing for the survey was outdated and inefficient, which resulted to an increase in number of non response (empty questionnaires) hence affecting the quality of estimates.

Due to the above mention drawbacks of the previous year HHs listings, the department had decided to change the HHs listing format for the year 2013 annual agriculture sample survey. The new format given below in a table form was used to collect the latest updated HHs listing containing all the necessary required information's.

Format for 2013 annual agriculture sample survey HHs listing

Sl.No	Name of head of the HHs	Village	H.no	T. no	Land cultivated/not cultivated	If Cultivated		Land left fallow		Land leased out		Land leased in	
						WLC	DLC	WLF	DLF	WLO	DLO	WLI	DLI
1	Pema	Benzibee	Ka-3-42	198	LC		11.37		4.63				
2	Jangchub	Benzibee	KA-3-39	106	LC		8.76		10.59				
3	Dolkar	Benzibee	KA-3-41	231	NC			3.7		1.5			
4	Sangay	Benzibee	KA-3-40	199	LC		14.87		7.93				

With the information collected using the above mention HHs listing format for 2013 sample survey the HHs which are engaged only in agriculture activities ie. LC HHs (Land cultivating HHs) were only included and NC HHs (Land not cultivating HHs/ empty HHs / Gungtongs) were excluded from the list in order to reduce the non response.

And also the agriculture land utilized area information collected with the above list was used as indicator/auxiliary information to come up with an appropriate sample size for the survey.

4) Questionnaire design

The survey questionnaire used for the Agriculture Survey 2013 was the revised version of the Agriculture Survey 2012. The revision was done by the Agriculture Extension and Information Management Section (AEIMS) of the Department of Agriculture (DoA) in consultation with the division heads and representatives of all the twenty Dzongkhags. The main purpose of the revision of questionnaire was to do away with some of the unwanted data variables in the previous questionnaire, to include that information which was felt necessary for the implementation of 11th five year plan and also to meet the demand of information with time.

5) Sample size

Given that the geographical distribution of crops is based on the different ecological and climatic conditions, it is not feasible to produce precise survey results for all crops in each geog/sub districts. Since the agriculture has many indicators to be estimated like annual crop production estimates, yield estimates, agriculture engaged area estimates and fruit trees estimates etc... Which depends on so many variables both natural and non natural, it was really difficult to come up with a rigid sample size which could give a precise unbiased efficient estimates.

However, in the case of 2013 annual agriculture sample survey the department was able to come up with a formula for sample size calculation using the information collected on agriculture utilized area from the new HHs listing format as an indicator. The department would like to sincerely thank the FAO consultant for the IDCA project Bhutan and also the NSB officials for guiding and helping to come up with an appropriate formula for the sample size calculation.

The formulae given below were used for sample size calculation:

$$\text{The initial sample size } n_0 = \left(\frac{z^2 * 100 * \text{CV area}}{P} \right)^2$$

Here, n_0 = is the initial sample size

Z = is the statistic that defines the level of confidence desired, at 95% Confidence Interval the value of $z = 1.96$

$C.V$ = non percentage $C.V$ (coefficient of variation) of the agriculture utilized area was taken for this survey.

Non percentage $C.V = SD \text{ area} / \bar{x} \text{ area}$

P = the value of population proportion “ p ” or Margin of error is set at 15% ie. 0.15 at geog level.

The final sample size is given by,

Using Population correction factor we have:

$$n = \frac{n_0}{(1 + (n_0 / N))}$$

Where, N = Population size / total farming Households.

6) Sampling Design

For this year's survey a **Circular Systematic sampling** method was adopted to select the sample at the geog/sub districts level pertaining to its advantage over the linear systematic sampling.

The farming households in the geog were taken as the ultimate sampling units from which the samples were selected using circular systematic sampling.

7) Data Collection

The data collection was carried out during April-July 2014 and as usual, by agriculture extension officials (EAs) posted in the gewogs under the supervision of Dzongkhag agriculture sector heads. Twenty assistant Dzongkhags agriculture officers (ADAOs) were briefed on the use of the questionnaire and methods of data collection, who in turn trained the field agriculture staff on the use of the questionnaire for data collection.

8) Data Entry and Processing

From, this year onwards the Department in consultation with the Dzongkhag Agriculture officials had decided to decentralize the data entry and processing at Dzongkhag level in order to improve the quality of data, save time and also to reduce the cost burden due to centralized data entry system at Thimphu.

The database for 2013 survey was designed in CSIRO software by the asst. IT officer of PPD in collaboration with the programmers from National Statistics Bureau. To facilitate the above mandate of decentralization the AEIMS under the Department in collaboration with the asst. IT officer of PPD had organised a four days training on CSIRO software for the focal persons from RDCs and Data Managers (ADAOs) of 20 Dzongkhag from **9th to 12th September 2014** at Thimphu. During this four days training the focal persons from Research Development centres (RDCs) and the 20 Dzongkhag Data managers (ADAOs) were thoroughly trained in using CSIRO software for data entry and processing. The data entry and processing for 2013 agriculture sample survey was done at the Dzongkhag by the Dzongkhag Agriculture and Extension officers from October to November 2014. The ADAOs (Data managers) coordinated the data entry and processing at the Dzongkhags. After successfully completing the data entry and processing at Dzongkhag level the ADAOs were instructed to send the soft copy of the raw data in CSIRO file to the Department latest by end of November 2014 for further analysis purpose.

9) Data Analysis and Estimation

The data analysis was done in the month of December 2014 by the AEIMS officials under the Department of Agriculture. Data analysis was done in SPSS version 20 provided by NSB.

Yield Estimation:

For the major cereal crops, horticulture crops and fruit crops the yield provided by the survey was cross checked with the yield of the crop cuts carried out by the geog agriculture extension officers.

Where ever the department felt there was some issues related to the yield provided by the sample survey the yield estimated from the crop cut carried out by the geog extension officials were used.

Production= Estimated total area (from the sample survey) * Estimated yield (from the crop cut)

The weight estimation procedure was used to represent the estimates of population from the sample survey. Therefore it is necessary to multiply the data by a sampling weight, or expansion factor. The basic weight for each sample household would be equal to the inverse of its probability of selection. The sample design for the agriculture survey 2013 was a self-weighting within stratum, meaning that all the sampled or the enumerated households within a geog will have the same weight.

Adjustment for non-response/ Non response Weight

In order to adjust for the loss of representativeness caused by non-responding households, the weight of the responding units (**Wt_Eh**) was increased by deploying the following formulae. It is the reciprocal/inverse of the percentage responding units from the sample.

$$\text{Non response Weight} / W_{nr} = \frac{1}{Eh / Sh} \rightarrow \boxed{\frac{Sh}{Eh}}$$

Where: $\frac{Sh}{Eh}$ = Sampled households in the geog
 Eh = Enumerated households in the geog

Design Weight / Weighting for probability of sample selection

The design weight or base weight is the inverse of probability of selection of the sample. Based on the Circular systematic sampling design, the probability of selection for the sample households in a geog was calculated as follows:

$$\text{Design weight/Base weight/ } W_d = K \rightarrow \boxed{\frac{Nh}{Sh}}$$

Where: Nh = Total households in the geog
 Sh = Sampled households in the geog

Therefore the final weight becomes / FW = $W_d \times W_{nr}$

(Or)

The Final WEIGHT = Design Weight × Non response Weight

Finally, the estimation for observed values in the gewogs has been obtained by multiplying each sample data with the final weight (FW) calculated for the each gewogs.

Therefore, the estimate of a *total value* (such as total production) is the product of the final weight, FW and the value, y_i , for each responding unit, summed over all responding units:

$$\hat{Y} = \sum_{i=1}^n FW \times y_i$$

B. Survey Coverage and Scope

From the new updated total rural households (area list frame gathered from geog extension centres) of 57,653, at least 13,944 (24% on average) were selected for the enumeration. The coverage was 13,297 (95%) of the total sampled households of 13,944. The non-response or the absentees stood at 5% (647) of the households selected for the survey. With the updated and new format of Household listing for the 2013 annual agriculture sample survey the non response had come down to 5% from 15.47% of the previous year.

Part 1

National level Statistics

C. SUMMARY FINDINGS

Following are the estimated Summary statistics based on the data collected from 13,297 sample farming Households from April to July 2014. The weight estimation method is used to estimate population parameters from the sample data.

Table1: Coverage of rural households by the survey 2013.

Dzongkhag	Total HHs(Sample frame)Nh	Sampled HHs/Sh	Percent Sampled	Enumerated HHs/(Eh)	Percent Coverage
Bumthang	1,317	400	30	399	100

Figure1: Bhutan's total population residing on the farm by sex, 2013.

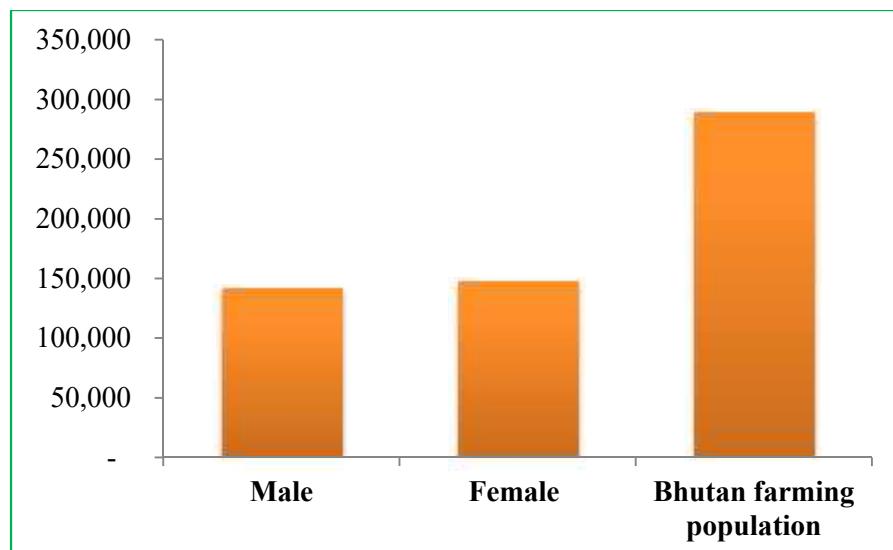

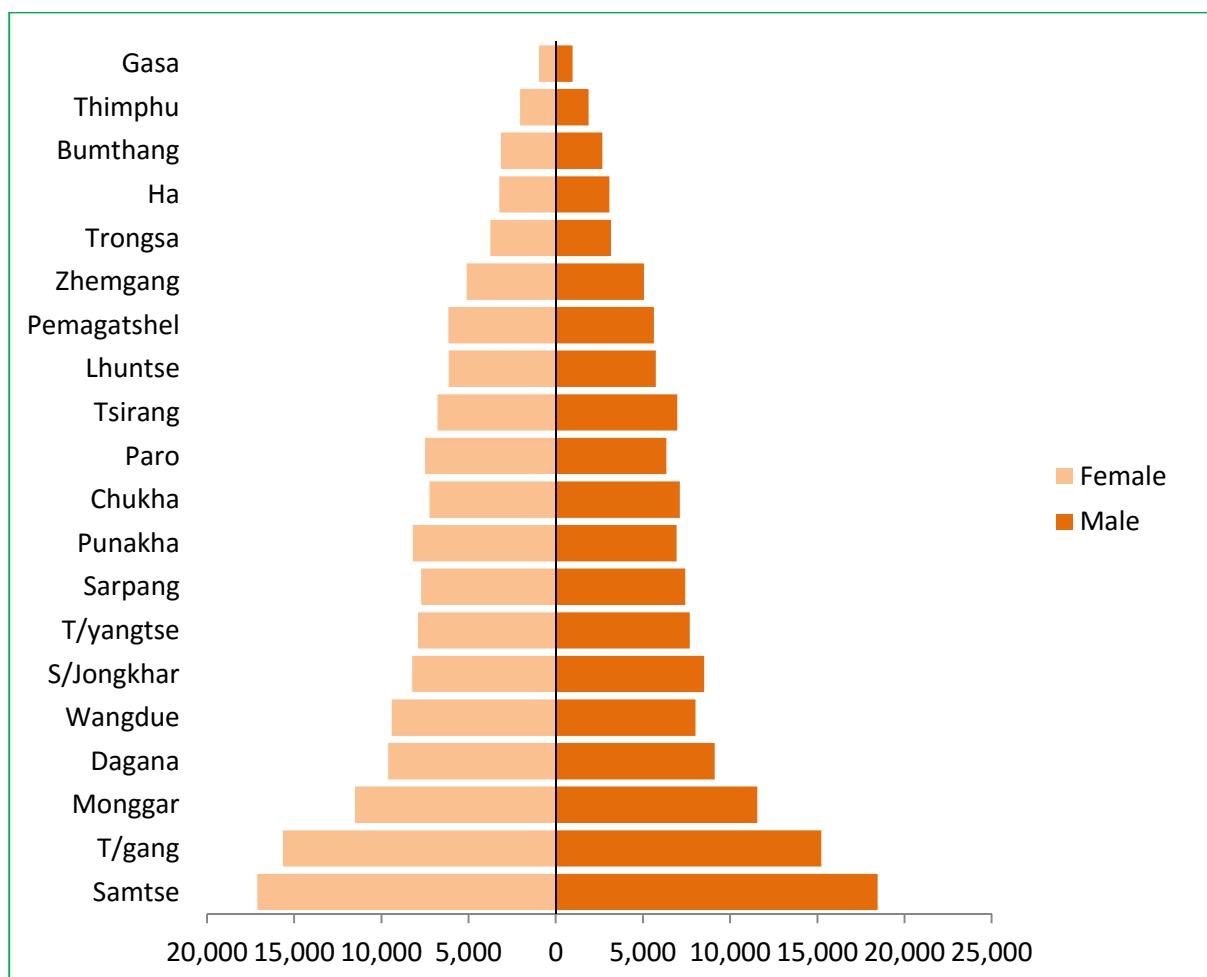

Figure2: Dzongkhag wise Population Pyramid by sex, 2013.

2) Land Utilization 2013

Dry Land

Note: Operational land holdings= Kamzhing own land cultivated + Kamzhing fallow + Kamzhing leased in.

Since only the farming households which are engaged in agriculture activities are included in the annual sample survey 2013 excluding Gungtongs(empty HHs) and HHs having land but not engage in agriculture activities the Kamzhing left fellow could be much higher than the estimated figure from sample survey 2013.

In year 2013 of the total estimated **135,927** acres of operational Kamzhing land holdings **39,890** acres were left fellow.

Dzongkhag	Kamzhing Own land Cultivated (Acres)	Kamzhing left Fallow(Acres)	Kamzhing leased-Out(Acres)	Kamzhing leased-In(Acres)	Operational land holdings
Bumthang	2,220	3,535	169	304	6,059

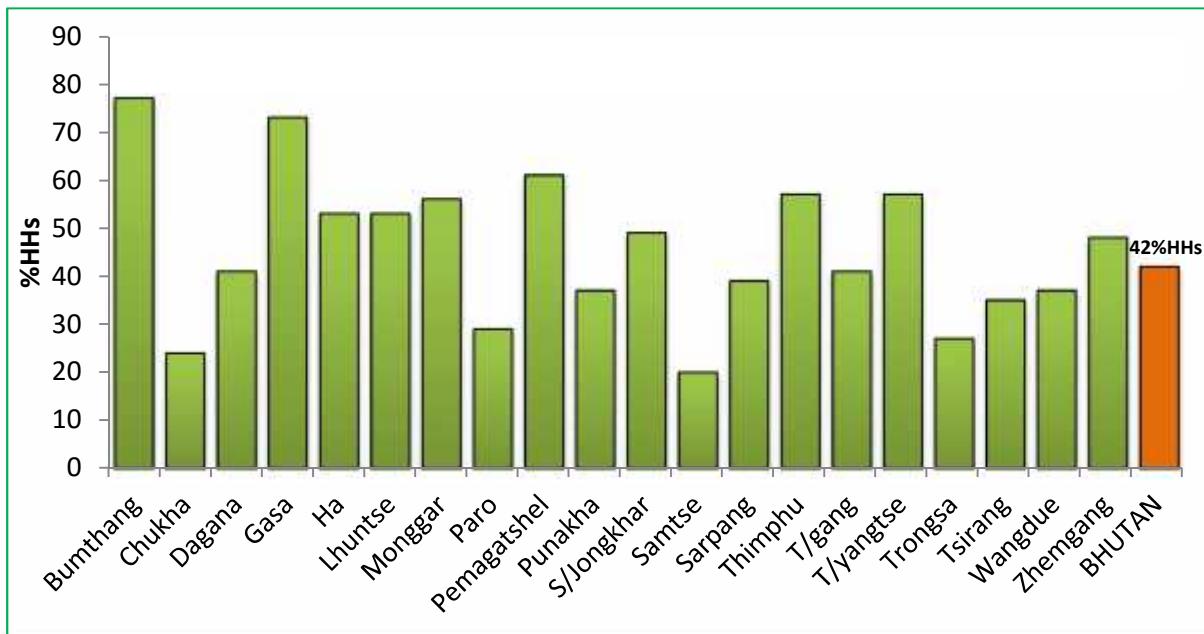

Figure 4: Rural Households Cash Income from forest edible product and other activities in year 2013

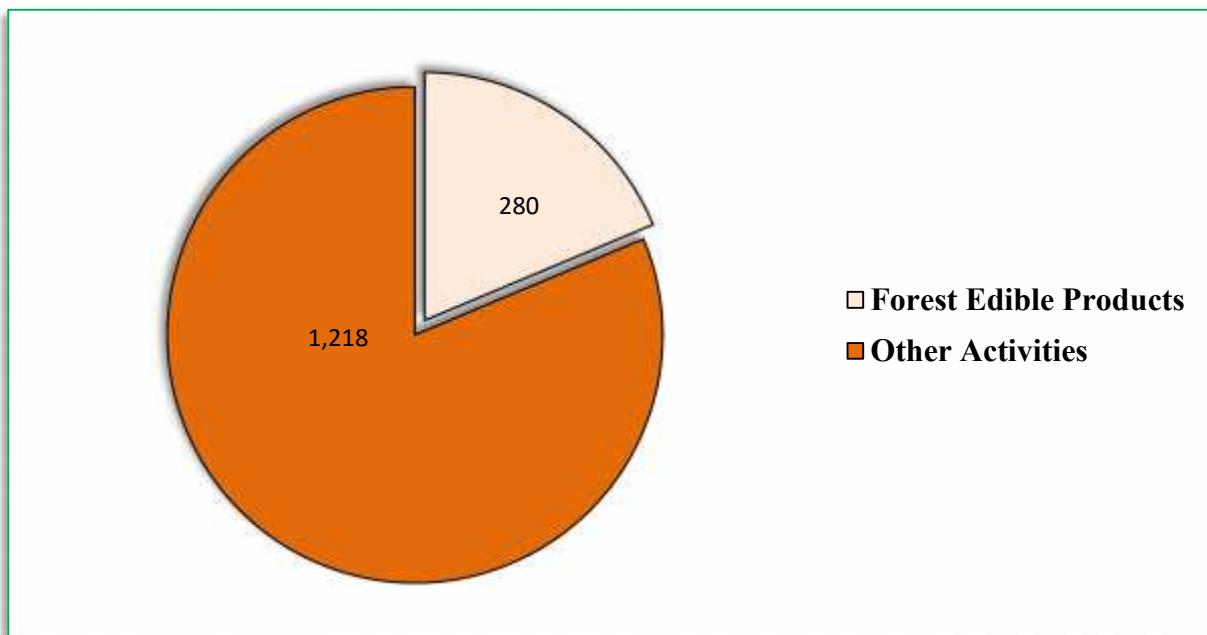

Table 7.2: Cash income from forest edible products and other activities in year 2013

Forest Edible Products	Amount Earned (Million Nu)
Bamboo products(Bamboo shoot)	0.87
Cane Products(Cane shoot/Patsha)	0.88
Fern(Nakay)	4.5
Damru	1.11
Medicinal Aromatic Plants & herbs	10.95
Wild Mushrooms	31.92
Cordyceps	229.74
Total Amount Earned	280
Other Activities	Amount Earned (Million Nu)
Weaving(Weaving and sale of woven products)	73.79
Pottering(Carrying luggage and other loads)	65.32
Business/Contact works	786.08
Part time skilled labour (eg. Carpentry ,Wood crafting, traditional painting)	293.15
Total Amount Earned	1,218

Table 7.3: Cash income from processed cereals products

Processed cereals	Qty Sold(MT)	Avg Unit Price(Nu/kg)	Amount Earned(Million Nu)	Type of Market	
				Domestic	Export
Rice	1,667	70	124	99.8	0.2
Zaw	301	82	20	100	0
Tengma	540	101	61	97.5	2.5
Kharang	26	59	2	100	0
Wheat flour	73	49	3	100	0
Buckwheat flour	5	47	0.3	100	0
Zaw flour	3	60	0.2	100	0
Maykuu	17	244	1	100	0
Local alcoholic beverage made out of cereals.			23	100	0

8) Food Security 2013

Table 8.1: Proportion of farming households by self-sufficiency of food (agriculture crops) for 2013

Dzongkhag	Did you produce enough agriculture crops (food) for your household?		%HHs with food (agriculture crops) shortage by months									
	Enough	Not Enough	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	
Bumthang	39	61	49	49	46	43	43	42	41	37	35

Figure 5: Estimated Proportion of farming HHs facing food (agriculture crop) shortages in the year 2013.

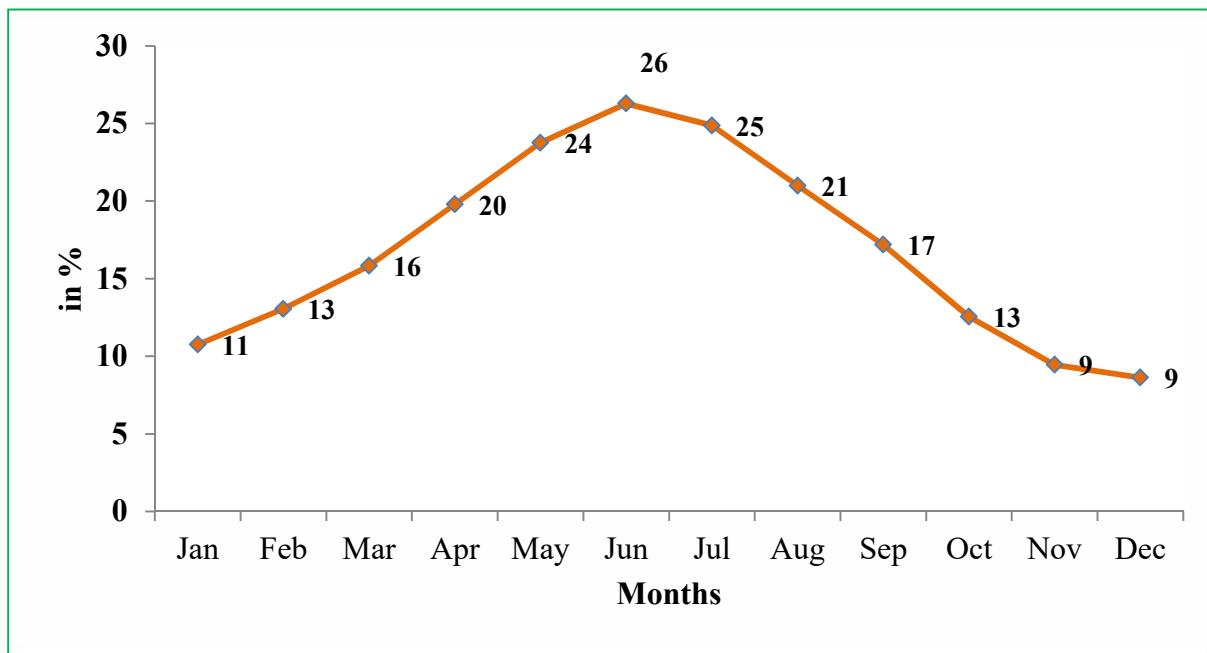

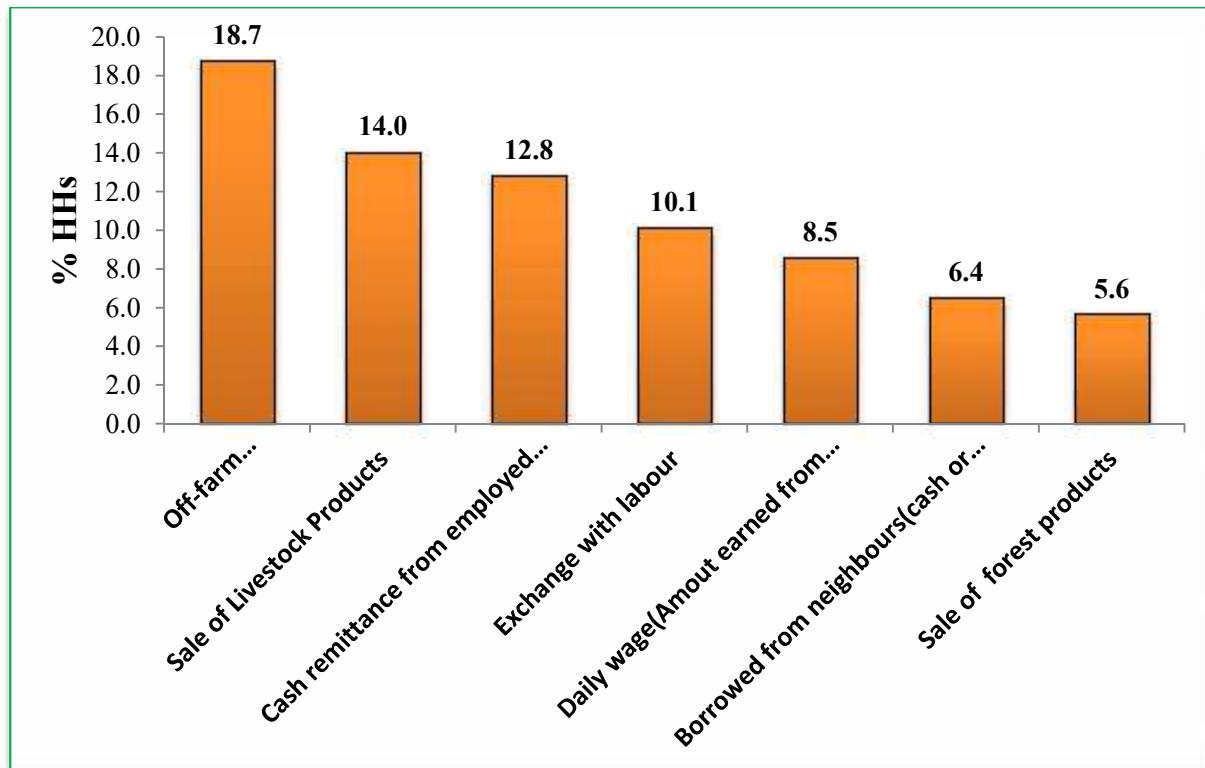

Table 8.2: Food shortage coping mechanism in 2013

Coping Mechanism used	HHs
Off-farm activities (weaving, pottering, Business/contract etc.)	18.7
Sale of Livestock Products	14.0
Cash remittance from employed members	12.8
Exchange with labour	10.1
Daily wage(Amount earned from working in others field)	8.5
Borrowed from neighbours(cash or agricultural products)	6.4
Sale of forest products	5.6

Figure 6: Proportion of HHs using various coping mechanisms to address the food (agriculture crop) shortages in 2013 for Bhutan.

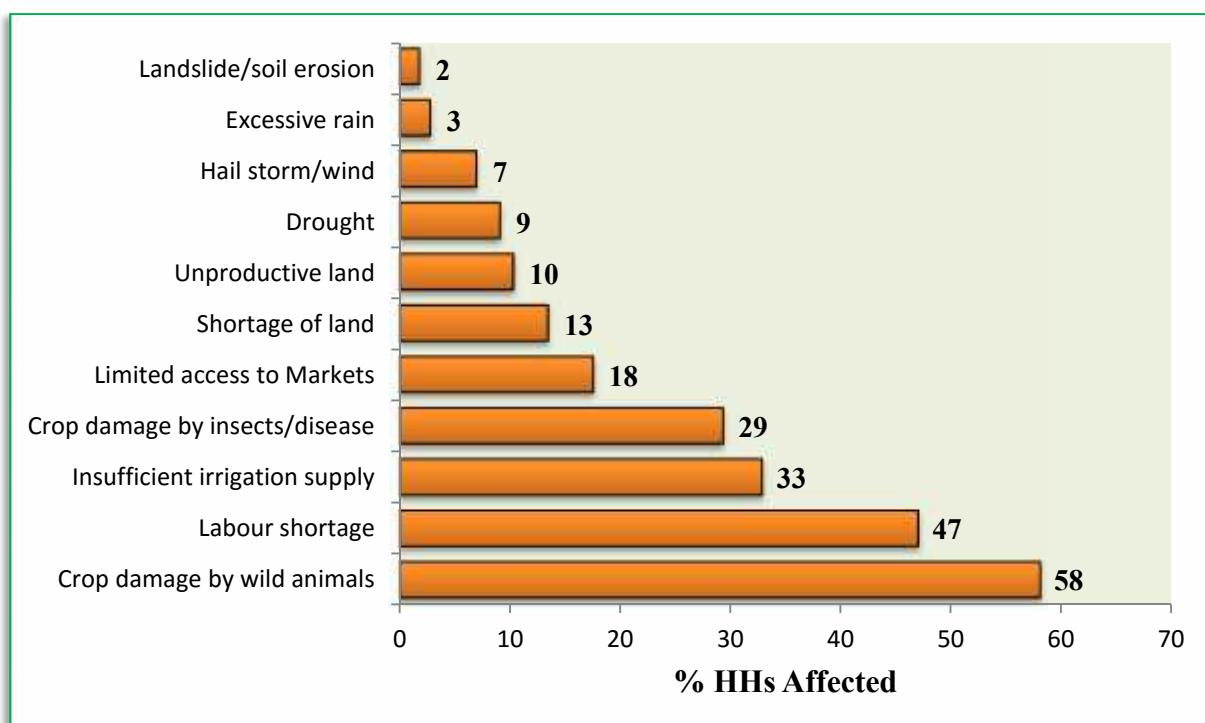

9) Farming Constraints faced

Table 9.1: Proportion of HHs affected by the various farming constraints in year 2013

Farming Constraints	% HHs affected by the various farming constraints
Crop damage by wild animals	58
Labour shortage	47
Insufficient irrigation supply	33
Crop damage by insects/disease	29
Limited access to Markets	18
Shortage of land	13
Unproductive land	10
Drought	9
Hail storm/wind	7
Excessive rain	3
Landslide/soil erosion	2

Figure 7: Percentage of farming HHs affected by various constraints in year 2013 for Bhutan.

10) Crop Damage by Natural Calamities and Food grain lost to the wild animals during the year 2013

Table 10.1: Dzongkhag wise proportion of HHs that experienced/ not experienced natural calamities that affect the yield and quality of the crops

BHUTAN	2,087,352	1,046,880	33,469	32

Foot note: Reduced production of mandarin in year 2013 could be attributed to declining citrus in most Dzongkhags, particularly in Pemagatshel where affected households are removing trees and replacing them with mangoes & litchi, in addition to reduced production in most Dzongkhags (Samtse for instance – as a result of hailstorm during flowering & old and declining orchards being converted to cardamom plantations).
